

Map Modeling Guidelines

1. set `level` attribute for **every** node (obligatory! test in map loading code!)
2. According to Simple Indoor Tagging
 - `indoor=room/area/corridor` marks an **area**
 - `indoor=wall` marks a **way**, in most places part of the above
 - stairs/elevators are `indoor=room` **and** `stairs=yes` resp. `highway=elevator`
3. Doors: node with `door=yes`
4. For navigation purposes:
 - way(s) with `indoor=highway` and `highway=(corridor|stair|elevator|ramp)`
 - connect those highways to the doors nearby
 - when adding this for a stair or an elevator, you may have nodes at the same location, but with different `level` values if the staircase stretches over more than two levels.
 - for large areas, such as lobbies, add multiple highways to avoid to guide the person to middle of the room, and then back
5. Add a relation, containing all nodes and ways, with

<code>type</code>	=	<code>building</code>
<code>name</code>	=	<code><name></code>
<code>latitude</code>	=	<code><lat></code>
<code>longitude</code>	=	<code><lon></code>
